1. We're missing import statements at the top - regarding **People** and **Houses** component.
2. We're missing **const styles** at the bottom, with **container** object so we can address that as `<View style={styles.container}>`
3. We're calling **this.props.fetchPeople()** inside **render()** method which is a bad practice, because this way we're going to refetch people over and over again. Better approach is to put network calls inside **componentWillMount** or **componentDidMount**.
4. In **const houses = mapPeopleIntoHouses(houses, data)**, we're having a syntax error. We should rename **const houses** to **const newHouses** or something similar - we shouldn't use the same variable name.
5. Two methods at the top **mapCompaniesIntoPeople** and **mapPeopleIntoHouses** - we should consider two options: if the code should be reusable, then we should make a high-order component possibly, otherwise - we should consider putting those two methods inside the App component. The whole idea is to separate UI from business logic.
6. **mapDispatchToProps** - from lines 40-42, I think it will not work. We need to use some middleware which will handle async operation for fetching people (redux-thunk, redux-promise,...).
